ArDescription: Sequence of the C. elegans cosmid C29E4.
A;Reference number: S44738
A;Accession: S44765
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-181 - WHL>
A;Cross-references: EMBL:L23651; NID:g388575; PID:g388576
C;Genetics: 46/3; 126/2; 150/3; 163/1
C;Superfamily: Caenorhabditis elegans C29E4.9 protein

cathelin-like antibacterial peptide precursor (clone C6) - pig (fragment)

N;Alternate names: antimicrobial peptide; prophenin-1

S;Species: Sus scrofa domestica (domestic pig)

C;Date: 27-oct-1995 #sequence_revision 03-Nov-1995 #text_change 20-Apr-2000

C;Date: 27-oct-1995 #sequence_revision 03-Nov-1995 #text_change 20-Apr-2000

S;Atrukelj, B.; Pungercar, J.; Kopitar, G.; Renko, M.; Lenarcic, B.; Berbic, S.; Turk

Biol. Chem. Hoppe-Seyler 376, 507-510, 1995

A;Title: Molecular cloning and identification of a novel porcine cathelin-like antiba

A;Reference number: S57330; MUID: 96042752
Cyaccession: B86410

hypothetical protein F8F16.190 - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 30-Apr-1999 #sequence_revision 30-Apr-1999 #text_change 30-Apr-1999
C;Accession: T04504
R;Bevan, M.; Brandt, P.; Dose, S.; Jarke, D.; Scharfe, M.; Schon, O.; Hoheisel, J.; M
submitted to the Protein Sequence Database, April 1998
A;Reference number: Z15375
A;Accession: T04504
A;Molecule type: DNA
A;Residues: 1-278 < BEV>
A;Cross-references: EMBL:AL021633
A;Experimental source: cultivar Columbia; BAC clone F8F16

The ActA protein of Listeria monocytogenes acts as a nucleator inducing reorganization of the actin cytoskeleton.",
EMBO J. 13:758-754(1994).

I- FUNCTION: VIRULENCE FACTOR REQUIRED FOR HOST CELL MICROFILAMENT INTERACTION. IT INDUCES ACTIN ASSEMBLY AROUND THE BACTERIA TO ALLOW IT TO MOVE WITHIN THE CYTOPLASM. IT IS INVOLVED IN THE ACTIN POLYMERIZATION PROCESS. IT SEEMS TO ACT AS A NUCLEATOR THAT INDUCES THE REORGANIZATION OF THE ACTIN CYTOSKELETON.

-1- SUBCELLULAR LOCATION: ANCHORED TO THE MEMBRANE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mus musculus (Mouse).

"CDNA cloning and characterization of sciellin, a LIM domain protein
"L. Biol. Chem. 273:31547-31554 (1998).
"I Biol. Chem. 273:31547-31554 (1998).
"I FUNCTION: May function in the assembly or regulation of proteins
in the cornified envelope. The LIM domain may be involved in
homotypic or heterotypic associations and may function to localize
sciellin to the cornified envelope.
"SUBCELLULAR LOCATION: Cytoplasmic. May become cross-linked to
membrane proteins by transglutaminase.
"ISSUE SPECIFICITY: Highly expressed in esophagus. It is also
cytossed in keratinocytes, amniotic tissue, foreskin stratum
spinosum and stratum granulosum, hair follicle and nail.
"SIMILARITY: CONTAINS I LIM DOMAIN. THE LIM DOMAIN BINDS 2 ZINC

```
Modulating cytoskeletal rearrangement to regulate T cell and macrophage activation for treating cancer, autoimmune disease, and infectious disease, comprises contacting with a Fyb/SLAP complex modulator
                                                                                                                                                        This peptide motif is found in zyxin, vinculin and other focal adhesion proteins containing an ActA-like motif. The N-terminal protein of novel murine Mena (mammalian Ena) protein (see AAW37148) contains an Ena-VASP homology domain (FVH1) that directs the proper localisation of Mena to focal contacts via directed protein-protein interactions with zyxin, vinculin etc. This suggests that the FPPPP motif may comprise the core recognition site in EVH1 ligands. Based on the disclosed Mena and Ev1 genes (see AAW37148-53), a variety of methods and compositions are provided for screening, isolating and characterising endopenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abhorant cell morphology, adhesion, motility, growth and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fyb/SLAP protein; EVH1 domain; cytoskeletal rearrangement; enabled/vasodilator-stimulated phosphoprotein protein; T cell; T cell receptor; Enal/VASP protein; lymphocyte; macrophage; platelet; infectious disease; cancer; autoimmune disease; inflammation; platelet aggregation; wound healing; clotting.
                                Detection of modulators of Mena and Ena-VASP-like genes and proteins - used in control of cytoskeletal dynamic events in normal and abnormal cell morphology, adhesion, motility, growth and

                                                                                                                                                                                                                                                                                                                               Internation describes a method for modulating cytoskeletal
rearrangement in a cell, or T cell response to T cell receptor
stimulation. The method comprises contacting the cell or T cell with
a Fyb/StAP complex modulator sufficient to modulate the formation
of a complex of an Ena/VASP protein and a Fyb/StAP protein. The
method is useful for modulating cytoskeletal rearrangement in a cell
such as a lymphocyte, preferably a T cell, a macrophage or a cell
fragment such as a platelet and for modulating T cell response to a
real receptor stimulation. T cell response is increased in a subject
having or at risk of developing infectious disease or cancer and T cell
response is inhibited in a subject having or is at risk of developing an
autoimmune disease or a condition characterized by infiammation. A
composition comprising a Fyb/StAP complex inhibitor is useful for
increasing platelet aggregation for promoting wound healing or
                                                                                                                  The present sequence represents a Fyb/SLAP complex inhibitor. Fyb/SLAP proteins are ligands for the EVH1 domains of Ena(enabled)/vasodilator-stimulated phosphoprotein (VASP) proteins. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cell migration; Ena/VASP; wound healing; actin polymerisation; neurodegeneration; Alzheimer's disease; Down Syndrome; trauma; stroke; Parkinson's disease; amyotrophic lateral sclerosis; ALS; epilepsy; Huntington's disease; ALS-Parkinsonisan-dementia complex; bulbar palsy; Tourettes syndrome; hypodyycaemia; hypoxia; Creutzfeldt-Jakob disease; Korsakoff's syndrome; learning; memory; brain damage; senile dementia; inflammatory disorder; arthritis; allergy; gout; organ transplant;

The invention relates to a method of preventing mammalian cell migration, comprising inducing a functional Ena(enabled)/vasodilator-stimulated phosphoprotenin (WASP) or promoting cell migration comprising depleting functional Ena/WASP protein in the mammalian cell. The method is useful for preventing or promoting mammalian cell migration, preferably tumour cell migration in vitro or in vivo and to prevent tumour cell metastasis in a subject. An Ena/WASP activator or inhibitor is useful for promoting wound healing, preferably fibroblasts or nerve cells of a tissue type with the inhibitor to promote actin polymerisation and tissue formation or a scaffold The inhibitor is also useful for preventing command. Huntington's disease, epilepsy, ALS-Parkinsonism-dementia complex, progressive supranuclear palsy, progressive bulbar palsy, progressive publication and progressive supranuclear palsy, progressive bulbar palsy, spandomouscular atrophy, creebral amyloidosis, pick's atrophy. Retts complex, progressive and korsakoff's syndrome. The Ena/Wasp cretebellar degeneration, Tourettes syndrome. The Ena/Wasp cretebellar degeneration, Tourettes syndrome. The Ena/Wasp cretebellar degeneration at sistence and korsakoff's syndrome. The Ena/Wasp cretebellar degeneration and an amount for inhibiting disorder such as allowed disease, creutzfeldt-Jakob disease, brain damage, benile candentia, korsakow's disorder and age-related memory loss. The inhibitor is administered in an amount for inhibiting the activity of Mena in a synapse. Ena/Wasp activator is administered in an amount for inhibiting the activity of man enamount configuration and the activator is administered in an amount for inhibiting the activity of Ena/Wasp protein in immune or haematopolatic cells reduces the ability of the cells to migrate and this is useful for treating and preventing inflammatory configurative collitis and isohemic diseases and also for treating cancer of metastasis. The present sequence represents the aminor of the activator is administered in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Activating sequence; Gal4; transcriptional activator; RNA polymerase; Protein protein interaction; gene therapy; therapeutic; holoenzyme;

AAW31412-W31459, AAW31461-W31481, AAW31483-W31493 and AAW39053-W39076

are fragments used in an assay to determine novel transcriptional
activators. The method involves the production of transcriptional
activators comprising of a DNA-binding group and a 6-25 amino acid
peptide that is covalently bonded to the DNA binding group and does not
represent a fragment of a natural transcription activator.
Protein-protein interactions are identified in the assay by fusing a
DNA-binding domain to a library of DNA fragments and introducing this and
a fusion of target protein and a polypeptide containing a region of Gal4
which interacts with GallIP into a cell containing GallIP and identifying
members of the library that interact with the target from activation of
transcription. Such constructs are used to activate transcription in a
cell, e.g. for controlling gene activity, particularly in gene therapy
(e.g. recognizing a site close to a selected therapeutic gene).
Transcription can be activated without blocking other transcriptional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cell migration; Ena/VASP; wound healing; actin polymerisation; neurodegeneration; Alzheimer's disease; Down Syndrome; trauma; stroke; Parkinson's disease; amyotrophic lateral sclerosis; ALS; epilepsy; Huntington's disease; ALS-Parkinsonism-dementia complex; bulbar palsy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       activators. They probably act by interacting with a component of the F polymerase II holoenzyme, Gall1, the strongest known yeast activator, which provides a more sensitive assay allowing detection of even weak protein-protein interactions. Such activators do not create toxicity problems even when overexpressed.
                                                                                                                                             New transcriptional activator containing DNA binding domain bound to peptide - useful for controlling gene expression, especially in gene therapy, and in protein-protein interaction assays, does not inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enabled protein; Ena; vasodilator stimulated phosphoprotein; VASP;

Court of Scattory in this intervence.

Court of Scattory in this intervence.

Court of Scasse, amyotrophic lateral Sclerosis (ALS), stroke, direct trauma, Huntington's disease, epilepsy, ALS-Parkinsonism-dementia complex, progressive supranuclear palsy, progressive bulbar palsy, progressive bulbar palsy, spinomuscular atrophy, cerebral amyloidosis, pick's atrophy, Retts cereballar degeneration, Tourettes syndrome, hypoglycaemia, hypoxia, creutzfeldt-Jakob disease and Korsakoff's syndrome. The Ena/VASP (Chutzfeldt-Jakob disease and Korsakoff's syndrome, The Ena/VASP (Chutzfeldt-Jakob disease, brain damage, senile subject having or at risk of developing a learning disorder such as Alzheimer's disease, Creutzfeldt-Jakob disease, brain damage, senile dementia, Korsakow's disorder and age-related memory loss. The inhibitor is administered in an amount for inhibiting the activity of Mena in a synapse. Ena/VASP activator is useful for disrupting learning and memory contractions of the activator is administered in an amount to promote Bara/VASP contraction of the activity of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention relates to a method of preventing mammalian cell migration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising inducing a functional Ena(enabled)/vasodilator-stinulated phosphoprotein (VASP) or promoting cell migration comprising depleting functional Ena/WASP protein in the mammalian cell. The method is useful for preventing or promoting mammalian cell migration, preferably tumour cell migration in vitro or in vivo and to prevent tumour cell metastasis in a subject. An Ena/WASP activator or inhibitor is useful for promoting wound healing, preferably fibroblasts or nerve cells of a tissue type with the inhibitor to promote actin polymerisation and tissue formation on a saffold. The inhibitor is also useful for preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein-FE65 interaction. Inducing the activity of Ena/VASP protein in immune or haematopoietic cells reduces the ability of the cells to migrate and this is useful for treating and preventing inflammatory disorders such as arthritis, allergy, gout, organ transplant, ulcerative colitis and ischaemic diseases and also for treating cancer metastasis. The present sequence represents the amino acid sequence of Ena/VASP homology (EVH) proline-rich motif #3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           regeneration, treating, neurodegenerative disease and metastasis, by inducing or depleting a functional enabled/vasodilator-stimulated phosphoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Regulating cell motility for promoting wound healing and tissue
                                                                                                                                                                                                                                                                                                                                                                                                             Wehland J, Loureiro JJ;
